## Ammonia emissions from land spreading manures – Review of Guidance Document

#### EPMAN 2

#### Garmisch-Partenkirchen, 27 April 2009

Stan Lalor, Tom Misselbrook, Shabtai Bittman, Gary Lanigan, Ken Smith, Jim Webb

# EPMAN 1

- Land Application group outcomes
  - Guidance document should drive the Code of Practice
  - But, Current Code of Practice is an older document?
  - No major changes required
- Decision
  - Review Guidance Document (document ECE/EB.AIR/WG.5/2007/13)
    before amending Code of Practice (document EB.AIR/WG.5/2001/7)

#### Proposed changes to Guidance Document

- 1. More text regarding other potential loss pathways (avoid pollution swapping)
- 2. Clarification of terms and description of application techniques
- 3. Ammonia reduction efficiencies
  - More ranges rather than single figures
  - Discussion of factors that influence ranges
  - Include models for ranges (where appropriate)
- 4. Costs
  - Remove €/m<sup>3</sup> costings
  - Replace with relative costs / ranking basis
- 5. Revisit category 1, 2 and 3 classifications
- 6. Include literature references

- 1. More text regarding other potential loss pathways (avoid pollution swapping)
  - Already mentioned in paragraph 21

"Lowering NH3 emissions may increase the amount of N available for plant uptake, so mineral N fertilizer application rates may need to be adjusted. Some techniques may temporarily decrease crop yield (especially of grass) through mechanical damage. There is also potential for increasing N losses by other pathways, e.g. nitrate leaching, nitrification or denitrification, the latter two processes resulting in greater emissions of nitrous oxide ( $N_2O$ )."

- Timing of application for maximum crop N uptake (paragraph 17)
  - Not necessarily going to help reduce NH<sub>3</sub> emissions
  - Will help reduce nitrate and N<sub>2</sub>O losses
- Further inclusions ??
  - N<sub>2</sub>O Injection vs. incorporation (Webb review)

- 2. Clarification of terms and description of application techniques
  - More descriptive text on machine classifications included

(e.g. band-spreading: trailing hose vs. trailing shoe)

- 3. Ammonia reduction efficiencies
  - Table 2(a)
  - More ranges rather than single figures
    - Ranges included
  - Discussion of factors that influence ranges
    - New column included
  - Include models for ranges (where appropriate)
    - Scope for inclusion / of equations / models
  - Webb review

	Abatement measure	Type of manure	Land use	Emission reduction	Factors affecting emission reduction	Applicability	Estimated costs relative
te	Trailing hose	Slurry	Grassland, arable land	20-30 Emission reduction may be less if applied on grass <10 cm.	Height of crop canopy	Slope (<15% for tankers; 25% for umbilical systems); not for slurry that is viscous or has a large straw content; size and shape of field should be considered.	1.4
	Trailing shoe	Slarry	Mainly grassland	20-60**	Height of crop canopy	Slope (<15% for tankers; 25% for umbilical systems); not viscous slurry; size and shape of the field; grass height should be >8 cm.	1.6
er	Shallow injection (open slot)	Slurry	Grassland	70-80**	Slurry spillage out of injection slits	Slope <10%; greater limitations for soil type and conditions; not viscous slurry	1.8
	Shallow injection (closed slot)	Slurry	Mainly grassland, arable	80-90	Effective slit closure	Slope <10%; greater limitations for soil type and conditions; not viscous	2.0
jes	Broadcast application? and incorporation by plough in one process	Slurry	land Arable land			slurry Only for land that can be easily cultivated	
	Broadcast application and incorporation by plough (costs for < 4 h) Incorporation by	Slurry	Arable land	50-60 60			
	disc			00			
ion /	Broadcast application and incorporation by plough within 12 h	Slurry	Arable land	15		(according to § 10)	
	Timing of application and weather conditions	Slurry	Grassland and arable	0-30	Lower wind speed air temperature, and solar radiation; higher rainfall and relative humidity. Often associated with season (e.g. spring)	Dependent on availability of spreadland with suitable soil trafficability and herbage canopy conditions	1.0

Abatement measure	Type of	Land use	Emission	Factors affecting	Applicability	Estimated
	manure		reduction	emission reduction		costs relative
			(%)			to reference
Trailing hose	Slurry	Grassland, arable land	20-30 Emission reduction may be less if applied on	Height of crop canopy	Slope (<15% for tankers; 25% for umbilical systems); not for slurry that is viscous or has a large straw content; size and share of field should be	1.4
Trailing shoe	Slurry	Mainly	grass <10 cm. 20-60**	Height of crop	considered. Slope (<15% for tankers;	1.6
		grassland		canopy	25% for umbilical systems); not viscous slurry; size and shape of the field; grass height should be >8 cm.	
Shallow injection (open slot)	Slurry	Grassland	70-80**	Slurry spillage out of injection slits	Slope <10%; greater limitations for soil type and conditions; not viscous slurry	1.8
Shallow injection (closed slot)	Slurry	Mainly grassland, arable land	80-90	Effective slit closure	Slope <10%; greater limitations for soil type and conditions; not viscous slurry	2.0
Broadcast application? and incorporation by plough in one process	Slurry	Arable land			Only for land that can be easily cultivated	
Broadcast application and incorporation by plough (costs for < 4 h)	Slurry	Arable land	50-60			
Incorporation by disc			60			
Broadcast application and incorporation by plough within 12 h	Slurry	Arable land	15		(according to § 10)	
Timing of application and weather conditions	Slurry	Grassland and arable	0-30	Lower wind speed air temperature, and solar radiation; higher rainfall and relative humidity. Often associated with season (e.g. spring)	Dependent on availability of spreadland with suitable soil trafficability and herbage canopy conditions	1.0

4. Costs

- -Remove €/m<sup>3</sup> costings -Replace with relative costs / ranking basis • Costing including (estimated scale relative to splashplate as reference method)
  - Webb review

- 5. Revisit category 1, 2 and 3 classifications
  - Timing of application and weather conditions switched from category 2 into category 1
  - Reduce time for incorporation of surface applied manures/slurries to 4 hours

- 6. Include literature references
  - No progress to date
  - Suggest to include in unobtrusive way
  - Input form previous authors/reviewers of Guidance Document?

# Completing the Review

Concensus required on a number of issues:

- Inclusion of references who?
- More text on pollution swapping / co-benefits
- Decisions on: (Webb review + others)
  - Emission reduction ranges (+ models)
  - Costings and units to use
  - Category 1, 2 & 3 techniques
